

# Discovery on Gray Rock Property Provides New Exploration Model for the Atlin Gold Camp

Specimens from Otter Creek on Gray Rock's Surprise Lake Property

Based on geochem results and grab samples, the current target extends for 1.2 kilometers with a width of at least 800 meters.

The type of host rock at Surprise Lake, along with the placement and condition of gold specimens (up to an ounce in size), indicate the new discovery may be a key source of the camp's extensive placer gold.

## Visible gold and a staking rush

The discovery of coarse, visible gold in bedrock on Gray Rock's Surprise Lake property has generated a staking rush and a new model for lode gold exploration in the Atlin region of northern British Columbia. Following news of the discoveries, and a 2016 report by the BC Geological Survey (BCGS), over 76,000 adjoining and nearby hectares were staked. According to the BCGS, the Surprise Lake discovery "...significantly expands the lode gold exploration target" for the Atlin camp.

## Why is this discovery so important?

Prospectors and exploration companies have searched for the lode source of Atlin's rich placer gold for over a hundred years. The type of host rock at Surprise Lake, along with the placement and condition of gold specimens (up to an ounce in size), indicate the new discovery may be a key source of the camp's extensive placer gold. Over 700,000 ounces have been mined to date in the camp.

## A large target for further exploration

The gold discoveries, resulting from placer mining in Otter Creek, imply the existence of a very large system related to the Surprise Lake batholith. Based on geochem results and grab samples, the current target extends for 1.2 kilometers with a width of at least 800 meters.

## DeCoors Mining leads exploration

In February 2017, Gray Rock concluded an agreement with DeCoors Mining to acquire the Surprise Lake Property along with six early-stage exploration properties in northern BC. Under the agreement, the DeCoors team will lead the program at Surprise Lake. DeCoors is a private company comprised of experienced prospectors, geologists and successful placer miners who have devoted decades to exploration around Atlin and other prospective regions in the province.

# ...significantly expands the lode gold exploration target

## Gray Rock and DeCoors are launching a two-phase exploration program:

### Phase 1

Property-wide reconnaissance work including data compilation and GIS, aerial drone survey, soil geochemistry, geophysical surveys, trenching and mapping to identify drill targets.

### Phase 2

Diamond drilling of targets developed during Phase 1.

## Project Pipeline

Gray Rock's project pipeline covers three key mining regions in north, central and southern British Columbia.

### Area A - Atlin Lake Region

**Titan**, **UM/TP** and **Tardis** properties. Metal-rich showings and mineral-bearing anomalies.

### Area B - Central BC/Endako Region

**Cabin**, **GSLT** and **Ootsa** properties. Numerous mineralized structures for gold, silver, zinc and lead.

### Area C - Southern BC/Bralorne Region

**Silver Stream** property. Two distinct anomalies returning trench results up to 0.479 oz Au/ton.

## About Gray Rock Resources

Vancouver-based Gray Rock Resources is exploring a portfolio of precious metals properties in British Columbia, focused currently on our Atlin area holdings. Our strategy is to partner with exceptional exploration talent, build value through exploration, then find development partners to option projects to production.

### Management

**David Wolfen**, *President & CEO, Director*

**Malcolm Davidson**, *CPA, CA, CFO*

**John Buckle**, *P.Geo, Consulting Geologist, Director*

**Jean Pautler**, *P. Geo, Consulting Geologist*

**Brian Johnston**, *Financial Consultant*

**Peter Shorts**, *Consulting Prospector*
